

PAIN REDUCTION

Low frequency therapy helps to reduce pain and stress-related symptoms

Neurosonic significantly reduces or even eliminates pain completely. Because vibration simultaneously and comprehensively affects the entire body and especially the autonomous nervous system, it is a more effective alternative than locally effective therapies.

Lymphatic circulation becomes more effective and pain is alleviated

Even the feeling of relaxation that use of Neurosonic generates affects the nervous system and reduces the feeling of pain. Lymphatic circulation improves, fluid escapes from swollen tissues, and the tissue pressure drops. Pain is relieved, injuries may improve faster, and other problems due to edema, such as rigidity, are removed. Enhanced lymphatic circulation carries and removes the inflammatory waste from the damaged area. When tissues get more energy due to increased blood circulation, they also work better. This improves recovery and performance.

Effective aid to stress-related pain

Pain can be a result of muscular tension caused by prolonged stress and sleep debt, as well as changes in central nervous system function, tissue circulation, and fluid circulation. For stress related pain, it is typical that it may not be possible to find explanatory physiological defects despite the studies. Studies show the vibrations to have a significant effect on muscle blood flow. Low frequency therapy relaxes the muscles, improves blood circulation and oxygenation, and alleviates muscle pain.

Customer testimonials regarding sleep:

Neck, shoulder, and lower back pain ease or disappear

Tension headache or migraine stopped or relieved

Numbness of limbs disappears

Stomach pain relieved

Reduction in or elimination of swelling

Pain is reduced or completely eliminated

Chronic pain relieved

Pressure sensation eases and becomes lighter
